

FOOD ORDER MANAGEMENT SYSTEM USING LINKED LIST

Problem Statement:

Design and implement a console-based Food Order Management System in C++ using a Singly Linked List. The system should allow the user to add new food orders, display all pending orders, and place or complete an order.

Each food order is stored as a node containing Order ID, Customer Name, Food Name, and a pointer to the next node.

New orders are inserted at the end of the linked list. When an order is completed, the first node is deleted and the HEAD pointer is moved to the next node.

Objective

To implement a real-world application using a Singly Linked List.

To understand insertion, traversal and deletion.

To understand pointers and dynamic memory allocation.

To manage food orders using Linked List concepts.

Expected Result

The system should successfully add, display and complete food orders using a Singly Linked List.
