Algorithm

4. Start.
5. Read the number of offices n.
6. Read the cost matrix representing the fiber-optic connections between offices.
7. Replace zero values between different offices with infinity to indicate that no direct connection exists.
8. Mark the first office as visited.
9. Find the minimum-cost edge connecting a visited office to an unvisited office.
10. If no valid edge exists, display a message that the network cannot connect all offices and stop.
11. Display the selected edge and its cost.
12. Add the edge cost to the running total.
13. Mark the newly connected office as visited.
14. Repeat Steps 6–10 until n - 1 edges have been selected.
15. Display the final minimum cable cost.
16. Stop.
