ALGORITHM

Step 1: Start the program.

Step 2: Define a node structure containing data, a left pointer, and a right pointer.

Step 3: Create a binary search tree by inserting the given node values.

Step 4: Display the original tree using inorder traversal.

Step 5: Apply the mirror operation by interchanging the left and right children of every node recursively.

Step 6: Display the mirrored tree using inorder traversal.

Step 7: Apply the mirror operation a second time.

Step 8: Display the restored tree using inorder traversal.

Step 9: Verify that the original and restored traversals match.

Step 10: Stop the program.
